

Company: BATAS Hire Purchase Private Limited

Prepared By: Mahesh Singh Madai

Target Audience: Assessment Panel / Senior Leadership

1. Prioritized Business Questions & Strategic Rationale

In structuring this multi-page portfolio dashboard, my core philosophy was to move beyond passive data reporting and instead drive active operational risk management. I prioritized three overarching business areas:

- **Asset Quality and Regulatory Health (Pages 1 & 2):** For a Hire Purchase institution, unchecked non-performing assets (NPAs) pose an immediate threat to capital adequacy. I prioritized breaking down the portfolio by Nepal Rastra Bank (NRB) Classifications and measuring the 3-Month Rolling NPA Trend. This allows the board to monitor systemic risk shifts early, ensuring provisioning buffers are accurate before defaults impact liquidity.
- **Operational Pipeline Efficiency (Page 4):** Hire purchase is a highly competitive, volume-driven market (especially in automotive and equipment financing). I prioritized tracking Average Turnaround Time (TAT) down to the specific branch and product line. If our competitor's close vehicle asset agreements in 24 hours and a BATAS branch takes 5 days, we lose the customer.
- **Field Liquidity and Collection Discipline (Page 5):** Profitability in credit is determined entirely by recovery intensity. I prioritized identifying Uncontacted Overdue Accounts and Collection Efficiency (EMIs Paid vs. Due) to expose gaps in field team execution and pinpoint which regional asset classes are suffering from collection leaks.

2. Advanced DAX

In credit portfolio tracking, raw monthly NPA jumps can often present a skewed view of asset decay due to localized calendar distortions, seasonal collection peaks, or short-term operational backlogs. To eliminate this noise and reveal the true underlying directional trajectory of asset decay for senior leadership, I built a rolling 3-month macro trend measure using Time Intelligence DAX functions.

3. Data Insight: The "Uncontacted Risk" Paradox

During my exploration of the collections and overdue datasets, I discovered an unexpected operational anomaly: the relationship between delinquency size and collector activity.

Conventionally, one expects a collections team to focus their energy entirely on high-value overdue accounts. However, the data revealed that a substantial portion of the **"Never Contacted"** (Uncontacted Bucket) actually consisted of mid-to-high-tier overdue balances, while low-value, small-ticket accounts had incredibly high frequency of contact (0–3 days contact gaps).
